

Project Overview

This document outlines a complete Jira Setup & Workflow Configuration service including custom field design, automation rule architecture, dashboard creation, CSV data migration, and CI/CD pipeline integration.

Services Included

#	Service	Deliverable	Timeline
1	Custom Fields	Field schema per project type	1-2 days
2	Automation Rules	10+ trigger-action rules	1-2 days
3	Dashboards	KPI + sprint dashboard	1 day
4	Data Migration	CSV import + field mapping	2-3 days
5	CI/CD Integration	GitHub/Jenkins webhook setup	2-3 days

Custom Fields Architecture

Each project type receives a tailored set of custom fields designed to capture the metadata most relevant to your team's workflow:

Field Name	Type	Used In	Purpose
Story Points	Number	Stories, Tasks	Sprint planning & velocity
Sprint Goal	Text	Epics	High-level objective tracking
Risk Level	Select	All types	Low / Medium / High / Critical
PR Link	URL	Stories, Bugs	Link to GitHub pull request
Build Status	Select	Stories	Pending / Passing / Failed
Deploy Date	Date	Releases	Production deployment date
SLA Deadline	DateTime	Bugs, Support	Response time commitment
OKR Tag	Text	Epics	Quarterly objective reference
Business Value	Number	Epics, Stories	1-10 prioritization score
Compliance Tag	Select	All types	SOC2 / GDPR / HIPAA / None

Automation Rules Configuration

Automation rules are configured using Jira's native automation engine. Each rule follows a Trigger → Condition → Action pattern:

Rule Name	Trigger	Condition	Action
Auto-assign High Priority	Issue created	Priority = High	Assign to on-call member

Close Stale Issues	Scheduled (daily)	No activity > 14 days	Transition to Closed
Blocker Slack Alert	Label added	Label = blocker	Post to #incidents channel
PR Merge Transition	GitHub PR merged	Branch matches PROJ-*	Move to In Review
Deploy to Done	Deploy webhook	Environment = production	Transition to Done
Sprint Auto-label	Issue created	Sprint field set	Add sprint label
Bug Escalation	Comment added	Type=Bug, Priority=Critical	Notify team lead
SLA Warning	Scheduled (hourly)	SLA deadline within 2h	Send email alert

Dashboard Widgets Included

Widget	Type	Data Source	Refresh
Sprint Burndown	Line Chart	Active Sprint	Real-time
Issue Status Breakdown	Pie Chart	All Issues	Real-time
Team Velocity	Bar Chart	Last 6 Sprints	Per sprint
Open Bugs by Priority	Bar Chart	Bug Issue Type	Real-time
Recently Updated Issues	Issue Table	Project Issues	Real-time
Deployment Frequency	Counter	CI/CD Webhook	Per deploy

CI/CD Integration Architecture

The CI/CD integration connects your development pipeline directly to Jira issue lifecycle transitions:

Stage	Tool	Jira Trigger	Issue Action
Source Control	GitHub / GitLab	Branch name: PROJ-*	Link branch to issue
Build	Jenkins / GH Actions	Build started	Add build comment
Test	Jest / Cypress	Tests pass/fail	Update test status field
Staging Deploy	AWS ECS / Heroku	Deploy to staging	Transition: In Review
Production Deploy	Kubernetes / Heroku	Deploy success	Transition: Done
Rollback	Any	Deploy failed	Reopen issue + alert

Smart Commit Syntax

Command	Example	Action
#done	PROJ-123 #done	Transitions issue to Done
#comment	PROJ-123 #comment Fixed null pointer	Adds comment to issue
#time	PROJ-123 #time 2h 30m	Logs 2h 30m work

#in-progress	PROJ-123 #in-progress	Moves to In Progress
